Research conducted by Edwin W. Koc

Introduction

In conjunction with the Business-Higher Education Forum (BHEF), the NACE Center for Career Development and Talent Acquisition (NACE Center) undertook a research project to explore how those in the C-suite and those directly involved in the promotion and recruitment of college graduates view two skill sets likely to be critical in the future economy: data science and analytics* and cybersecurity.

For purposes of the project, “data science and analytics skills” were defined as the skills needed to discover, interpret, and communicate meaningful patterns in data; “cybersecurity” was defined as the protection or defense of information and communications systems and the data they hold against damage, unauthorized use, modification, or exploitation.

The NACE Center’s findings, presented here, reflect the views of those tasked with recruiting new college graduates for entry-level roles and those who prepare college students for entry into the world of work. The NACE Center conducted two surveys among the membership of the National Association of Colleges and Employers: Surveys were sent to 900 university relations and recruiting (URR) members and 1,600 college career services members. The surveys were open November 28, 2016, through March 17, 2017; a total of 66 URR members and 220 career services members responded. *(Note: BHEF’s results, which reflect the views of C-suite executives, are available through [Investing in Data Science](#). The report is available on the NACE website.)*

The responses to the surveys, though small and disappointing, are instructive: The overall lack of response coupled with a substantial number of incomplete responses indicate that there is very little awareness of programmatic issues surrounding the data analytics and cybersecurity skill sets among those directly involved in recruiting these at the university level. *(Note: Percents may not total 100 due to rounding.)*

* “Data analytics” is used throughout the text to refer to data science and analytics.

Highlights

Responses from URR professionals suggest the following:

- The impact of hiring those with data analytics skill sets is expected to be felt primarily in terms of operational efficiency; bringing these skills to bear on the organization's behalf is expected to result in reduced costs and an improved customer experience.
- Whereas the impact on operational efficiencies is generally expected to be significant, the impact on revenues is expected to be more modest.
- There is some confusion about how effective the firms in the study have been in establishing data analytics capabilities. Respondents see their organizations as effective in building an analytics-enabled work force but did not believe that the organizations are adequately supplied with enough data science employees or an adequate technical infrastructure.
- Given the nature of responses, there appear to be two possibilities related to the responding organizations' strategy for acquiring data science talent: 1) Organizations have not yet developed a talent acquisition strategy for data science/analytics, or 2) the operational arm of talent acquisition is not aware of the strategy—that is, there is a disconnect between those who have developed such a strategy and those who would be tasked with implementing the strategy to recruit data analytics talent at the entry level.
- The key to recruiting for data analytics skills is seen as developing a competitive compensation strategy. Inadequate compensation is seen as the biggest deterrent to recruiting this talent, while competitive compensation is seen as the most effective strategy for successfully recruiting for data analysis skills.
- There is general agreement that data analytic skills will be necessary for all management levels in the near future.
- Among URR respondents, there is very little knowledge of cybersecurity hiring. At the same time, there is a general belief that hiring cybersecurity talent directly from college/universities would be effective and that a competitive compensation package would be the best strategy for attracting cybersecurity talent.

Responses from career services professionals suggest the following:

- Data analytics are viewed as important skills, and the vast majority of responding institutions already have courses in place to teach these skills, particularly at the undergraduate level.
- Data analytics coursework appears to be required of some majors in virtually all the major disciplines (arts and humanities, business, mathematics and the physical sciences, social sciences, and engineering), although less so in the arts/humanities and social sciences than in other disciplines.
- Respondents identified data analytics coursework to be most aligned with business, even more so than math, science, or engineering.
- Caveat: Although career services respondents were generally experienced (the majority have been at their institutions for more than 10 years), a significant proportion do not seem to be knowledgeable about the academic requirements for their graduates. Approximately one-third did not know whether data analytics courses were required of graduates, regardless of discipline.
- Among those able to provide a response, enrollments are the most used criterion for assessing the strength of the data analytics program; however, a large group of respondents have no knowledge of how academic programs are assessed.
- For those who could express an opinion, there is an indication that adequate funding for data science/analytics programs is not available and hampers the development of these programs at colleges and universities. However, only about one-half of the respondents felt able to judge the adequacy of funding for such programs.
- Most respondents expect the demand for data analytics skills to increase in the near future; at the same time, however, they do not think these skills will be universally required for graduates. In addition, respondents could not address the questions surrounding the appeal of these programs to women or minority populations.

- There is general agreement that industry input into the development of data analytics coursework would improve the skills students would graduate with in this area. However, one-half of respondents are not aware of the involvement of industry with these programs at the current time.
- A majority of respondents believe that it would be advantageous for their students to be taught cybersecurity skills; however, the sentiment on behalf of developing cybersecurity skills is not as strong as it is for developing data analytic skills.
- A bare majority (52 percent) of the schools responding to the survey currently offer cybersecurity courses to their undergraduates.
- There is a strong consensus that enrollments in cybersecurity courses will increase in the near future, but there is no consensus that colleges and universities are increasing the number of cybersecurity courses that will be available to their students.
- As with data analytics, respondents felt that industry input in the development of cybersecurity courses would be very helpful.

Detailed results of both surveys follow.

|---|------------------------------|-------|-------|--------------|
| | Graduate job placement rates | 50.6% | 23.4% | 26.0% |
| | Enrollment rates | 57.7% | 11.5% | 30.8% |
| | Internship placements | 51.9% | 23.4% | 24.7% |
| | Grant funding | 22.7% | 25.3% | 52.0% |

FIGURE 46

| In addition to the items we just discussed, does your institution use any other ways to assess the strength of its undergraduate cybersecurity programs? | Answer Options | Response Percent |
|--|----------------|------------------|
| | Yes | 14.1% |
| | No | 12.8% |
| | I don't know | 73.1% |

“Other” responses included:

- Employers on campus
- Feedback from employers and industry agencies that support research
- Center of Academic Excellence in Cyber Defense Education and mapping to the DICE framework
- Participating in cybersecurity competitions
- End of program assessment and benchmarking
- Academic program reviews that include assessing program learning objectives and institutional learning objectives
- SLO course assessment—the same assessment that is used across the curriculum in all majors
- Student learning outcomes assessment
- Employer feedback, student satisfaction; [in addition] we are a Center of Academic Excellence for Cyber Security resulting in outside agencies reviewing our programs.
